

(P) Preparation	(I) Identification	(C) Containment
<div><div>1. Patch asset vulnerabilities</div><div>2. Perform routine inspections of controls/weapons</div><div>3. Ensure antivirus/endpoint protection software is installed on workstations and laptops</div><div>4. Confirm that servers and workstations are logging to a central location</div><div>5. Review firewall, IDS, and IPS rules routinely and update based on the needs of the environment</div><div>6. Restrict access to critical assets as needed</div><div>7. Conduct employee security awareness training</div><div>8. Restrict users to the least privileges required</div><div>9. Identify and correct GPO permissions abuse opportunities <sup>[1]</sup></div><div>10. Consider implementing WMI and security filtering <sup>[1]</sup></div></div>	<div><div>1. Monitor for:<div><div>a. Malicious scheduled tasks <sup>[2]</sup></div><div>b. Rogue Domain Controllers <sup>[2]</sup></div><div>c. Suspicious GPO changes <sup>[2]</sup></div><div>d. Commands/cmdlets and command-line arguments that may be leveraged to modify domain policy settings <sup>[2]</sup></div></div></div><div>2. Investigate and clear ALL alerts associated with the impacted assets</div><div>3. Routinely check firewall, IDS, IPS, and SIEM logs for any unusual activity</div></div>	<div><div>1. Inventory (enumerate &amp; assess)</div><div>2. Detect   Deny   Disrupt   Degrade   Deceive   Destroy</div><div>3. Observe -&gt; Orient -&gt; Decide -&gt; Act</div><div>4. Issue perimeter enforcement for known threat actor locations</div><div>5. Archive scanning related artifacts such as IP addresses, user agents, and requests</div><div>6. Determine the source and pathway of the attack</div><div>7. Contain any DLL loaded by processes that are not supposed to be loaded by that process</div></div>
(E) Eradication	(R) Recovery	(L) Lessons/Opportunities
<div><div>1. Close the attack vector by applying the Preparation steps listed above</div><div>2. Perform endpoint/AV scans on targeted systems</div><div>3. Reset any compromised passwords</div><div>4. Inspect ALL assets and user activity for IOC consistent with the attack profile</div><div>5. Inspect backups for IOC consistent with the attack profile PRIOR to system recovery</div><div>6. Patch asset vulnerabilities</div></div>	<div><div>1. Restore to the RPO within the RTO</div><div>2. Address any collateral damage by assessing exposed technologies</div><div>3. Resolve any related security incidents</div><div>4. Restore affected systems to their last clean backup</div></div>	<div><div>1. Perform routine cyber hygiene due diligence</div><div>2. Engage external cybersecurity-as-a-service providers and response professionals</div><div>3. Implement policy changes to reduce future risk</div><div>4. Utilize newly obtained threat signatures</div><div>5. Remember that data and events should not be viewed in isolation but as part of a chain of behavior that could lead to other activities</div></div> <div><div>References:</div><div><div>1. 2. Investigate and clear ALL alerts associated with the impacted assets

3. Routinely check firewall, IDS, IPS, and SIEM logs for any unusual activity
